FOREWORD

Today, the Federal Government is confronted by public and congressional demands to provide higher quality products and services as well as to operate more efficiently and effectively within tight budget constraints. Federal managers are being challenged to find new ways to achieve departmental and agency goals within the many constraints associated with public bureaucracies.

In hopes of bringing about these changes in government operations, many Federal agencies, including NASA, have begun to adopt the concepts, tools, and techniques of Continuous Improvement (CI).

This bibliography can help you identify articles and reports that relate to CI. Topics range from the general, including the philosophy and history of CI and basic approaches and strategies for its implementation, through the more particular: lessons learned from the public sector and from the private sector models. Also covered are management and strategic planning, including leadership and support, mission, and vision; specific elements of human resources administration, including training, recognition, empowerment, and teamwork; and customer focus and customer satisfaction. In addition, you will find references to methods and tools for process improvement such as concurrent engineering, computer applications, measurement, quality assurance, quality function deployment, statistical process control, and Taguchi methods.

Entries are drawn from the literature entered into the NASA Scientific and Technical Information Database from 1989 through 1991. It is hoped that Federal employees, managers, and contractors will follow up on the information found here, and will use it well to improve the processes, and thence the products and services, of their organizations.

An evaluation of the NASA's Marshall Space Flight Center (MSFC) strategy to implement Total Quality Management (TQM) in the Advanced Solid Rocket Motor (ASRM) Project is presented. The evaluation of the implementation strategy reflected the Civil Service personnel perspective at the project level. The external and internal environments at MSFC were analyzed for their effects on the ASRM TQM strategy. Organizational forms, cultures, management systems, problem solving techniques, and training were assessed for their influence on the implementation strategy. The influence of ASRM's effort was assessed relative to its impact on mature projects as well as future projects at MSFC. Author

Taguchi's quality loss function and his signal-to-noise ratio are reviewed for the three types of static measurable performance characteristics. For the cases of 'smaller the better' and 'larger the better' quality characteristics, the precise relation is derived and tabulated. For the 'nominal the best' case, no exact relation could be found but a relation in inequality form is provided between the two Taguchi quality functions. Author

A90-30771 PROVIDING FOCUS FOR CONTINUOUS IMPROVEMENT ACTIVITY

JEFFREY L. TURNER (Boeing Military Airplanes, Wichita, KS) IN: NAECON 89; Proceedings of the IEEE National Aerospace and Electronics Conference, Dayton, OH, May 22-26, 1989. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1989, p. 1468-1470. Copyright

The author describes the philosophy and actions necessary for the implementation of a total-quality environment. Total quality is a state of performance of all work processes that collectively provide the product or service. The framework for implementation of total-quality commitment (TQC) is characterized by an integration of problem-solving teams, the management of work processes, and quality-planning activity. Such an implementation design assures participation by all levels of the organization, attention to critical business activity, and measurable, long-term results. The management system changes required to implement TQC are defined. I.E.

A90-31679# BUILDING IN TOTAL QUALITY MANAGEMENT

G. A. REYNOLDS (Douglas Aircraft Co., Long Beach, CA) IN: AIAA/ADPA/NSIA National Total Quality Management Symposium, 1st, Denver, CO, Nov. 1-3, 1989, Technical Papers. Washington, DC, American Institute of Aeronautics and Astronautics, 1989, p. 15-18. (AIAA PAPER 89-3184) Copyright

Justification for the application of total quality management (TQM) and the application techniques are discussed. Responsibility, authority, and accountability (RAA) is noted as a fundamental tenet of TQM and serves as the 'litmus test' for determining what areas are good candidates for restructuring and if the new structure is appropriate. Previously, improvement efforts were not considered important enough to survive occasional cutbacks or were superseded by other more popular improvement programs. Beneficial change was not sustained, and positive results were marginal or even reversed. It is concluded that organizational structure must embody TQM as the prerequisite for sustaining continuous improvement. R.E.P.

Total quality management (TQM) is becoming accepted by many U.S. companies as the fundamental business strategy for increasing

their competitive position and for improving their financial performance. DOD has embraced it as a means to get higher-quality, more available products and services at prices more consistent with a shrinking defense budget. Application of TQM in an engineering-dominated aerospace business is described. Customer satisfaction is obtained through the quality of its nonhardware items such as data item submittals, design reviews, and engineering analyses. As a result it more closely resembles a service business than a product business. This concept is long-term, realizing that becoming an excellent operation is a managed progression at all levels of the organization. R.E.P.

The paper discusses the implementation of Total Quality Management (TQM). It begins with the foundation of TQM provided in management theory and practice, and explains the new perspective provided by TQM. An implementation strategy consisting of three phases is provided. Author

This paper examines the reasons why material management and accounting systems (MMAS; formerly the 'ten key elements') should be a total quality management initiative. MMAS represents a set of standards that will help position companies for TQM and launch them on the path of continuous improvement. It is concluded that the 'ten key elements' are a TQM initiative because they control and improve the process of doing business in aerospace and defense manufacturing. R.E.P.

Environmental issues associated with the total quality management (TQM) concept are considered. TQM emphasizes the need for gradual, continual organizational resistance. The role of management in providing goals and support is examined. The formation of a reward system which supports TQM is discussed. I.F.

The concept of total quality management (TQM) is applied to the design and development of structural subsystems. The process of designing and developing a system using the total involvement concept of TQM is described. It is noted that the use of product teams, people empowerment, concurrent product development, job ownership, and continuous product improvement provides quality and schedule improvement as well as improving and enhancing the working environment. The approach of Shore (1988) to total quality management (TQM) is described. It involves participation by all organization members in defining structure and methodology with the primary emphasis on satisfying the customer. The differences between Feigenbaum's (1983) version of TQM and Shore's are discussed. Consideration is given to the definition of quality, quality planning, acceptable quality level, the manufacturing process, statistical process control, quality costs, corrective action systems, quality training, and supplier quality. TOTAL QUALITY MANAGEMENT WITHIN MULTILEVEL MULTIGOAL HIERARCHICAL SYSTEMS - A CONCEPTUAL INTRODUCTION

FABIO R. GOLDSCHMIED and NICHOLAS V. PETROU IN: AIAA/ADPA/NSIA National Total Quality Management Symposium, 1st, Denver, CO, Nov. 1-3, 1989, Technical Papers. Washington, DC, American Institute of Aeronautics and Astronautics, 1989, p. 266-280. refs (AIAA PAPER 89-3252) Copyright

A multilevel, multigoal hierarchical system for the structural organization of total quality management is proposed. The hierarchical system consists of three levels: (1) level of description or abstraction (stratum), (2) level of decision complexity (layer), and (3) level of organization structure (echelon). The interaction of these three levels is discussed. The decision-making hierarchy includes a selection layer, a learning or adaptation layer, and a self-organizing layer; the decision units hierarchy is: a single level,

single-goal system, a single-level, multigoal system, and a multilevel, multigoal system. It is noted that hierarchical structures provide better resource utilization; adapt faster to environmental changes; and a unit failure does not completely effect the entire system. Four case histories of quality management and diagrams of the proposed system are provided. I.F.

WHY DON'T MORE COMPANIES IMPLEMENT TQM SUCCESSFULLY?

Organizational cultural transformation is necessary for the effective implementation of TQM. Functional teams consisting of research, engineering, production, marketing, and sales, are essential for an effective TQM program. Short, intermediate, and long term goals can be achieved with TQM if a complete organizational cultural transformation occurs. The steps necessary for a successful organizational cultural transformation and the elements that reduce or eliminate resistance to the cultural transformation are described. The roles of employees, management, and facilitator in establishing an effective TQM program are examined. Factors which hinder the cultural transformation and ways to avoid these problems are discussed. I.F.

Current problems in the management of U.S. service and manufacturing industries are addressed, with a focus on failures leading to the erosion of the U.S. competitive position in world markets, and a set of 14 fundamental changes in traditional scientific management techniques is proposed. Chapters are devoted to diseases and obstacles; quality and the consumer; quality and productivity in service organizations; new principles in training and leadership; and operational definitions, conformance, and performance. Also considered are standards and regulations, common and specific causes of improvement, the minimum average total cost of testing incoming materials and final products, organization for improvement of quality and productivity, and management transformation in Japan. Despite being called by some the 'alphabet soup program of the year', TQM is accelerating throughout the aerospace industry. However, organizational inertia can ground even the most soundly designed processes. Critical TQM implementation barriers and lessons learned have been accumulated and expounded on in this paper. Dealing with organizational culture is one of the most difficult issues. In high-technology environments, where people have been task-oriented and product-focused, engineers and scientists often struggle to embrace a process orientation that focuses on participative involvement and prevention. Successful implementation requires a fundamental change in the way companies are structured to do business. Active executive involvement and leadership are paramount to achieving this cultural leap. Without this senior level commitment and accountability TQM will not flourish. Author

TOTAL QUALITY MANAGEMENT - WHAT DOES IT MEAN TO AEROSPACE ENGINEERS?

GEORGE J. THIELEN (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: Aerospace Testing Seminar, 12th, Manhattan Beach, CA, Mar. 13-15, 1990, Proceedings. Mount Prospect, IL, Institute of Environmental Sciences, 1990, p. 17-20. refs

This paper outlines the origins and basic principles of the Total Quality Management (TQM) concept and its significance to engineers engaged in aerospace design, development and testing. Drawing on results of a recent AIAA survey, current U.S. engineering perceptions of TQM and 'quality of engineering design' are summarized and apparent weaknesses in the process of product development are identified. Changes in customer quality expectations and solicitations are also discussed, together with some recommendations for improving product reliability, producibility, and value through integrated design, development and testing activities. The authors describe the necessity of developing the Government Systems Group standard Software Quality Program (SQP), the background in developing the SQP, the advantages of the SQP, the components of the SQP, and the highlights of the SQP. The goal of the standard SQP was to develop common and reusable quality processes. The SQP will produce quality products, while the plan offers the advantages of compliancy, reusability, efficiency, effectiveness, consistency, cost savings, and portability. The components of the SQP include the policy, organization, plan, and handbook. The main elements of the SQP, which currently reflects government standards DOD-STD-2167A and DOD-STD-2168 for software development projects, are discussed. This standard SQP was developed using the total quality management process methodologies. The influence that the Software Engineering Institute's Capability Assessment had on developing and implementing this standard SQP is also discussed. I.E.

The quality economics principle establishes the relationship between the value of quality and the cost of quality. The manager of the quality function in an organization is guided by this principle in the task of insuring that the quality value of the outputs of the organization is higher than the investment made (cost of quality) to achieve that quality, and thereby contributes to the maximization of the return on investment and profit in the organization. A review is presented to show that the responsibility of the manager of the quality function in the organization has increased in scope to include productivity, associated with quality-related activities in particular, and production work in general. The engineering manager's success is being judged more

and more on qualitative measures concerning the human elements of their work. These new measures require engineers to become as skilled and at ease with the tools, methods, and techniques for qualitative issues as they are with more traditional quantitative tools, methods, and techniques. To achieve success toward these qualitative measures demands nothing short of a new way of thinking, indeed a new culture embodying new values and traditions. Engineering managers must use culture change mechanisms along with their other management tools so they can better understand and manage culture. They must view concepts such as just-in-time, total quality management, and continuous performance improvement as integral to culture change efforts; these concepts and corresponding programs require an underlying culture to create an environment for change. Engineers who want to manage and change culture and communicate these changes must become comfortable with hoopla and symbolism to add drama and life to their words and plans. Engineers must understand the elements of culture, become effective communicators, and master the tools, methods, and techniques of culture change. DOE

WILLIAM E. HUGHES, JR. Jul. 1991 35 p (AD-A238399) Avail: NTIS HC/MF A03 CSCL 12/3

Variation has been studied by statisticians and scientists for decades. Although variation is not a new concept, what is new is the awareness that variation affects everyday activities in the workplace. Modern man is plagued with variation problems ranging from raw materials to finished products and services. No matter how precise our methods of producing products and providing services becomes, there will always be some degree of variation. Today's thrust toward the Total Quality Management (TQM) concept will include the understanding of variation. In fact, the concept of variation may be analyzed in each of Deming's 14 points. Future variation issues will include the understanding and management of people. GRA

MANAGING THE TQM CULTURAL CHANGE

JERALD B. GARTMAN and JOHN S. W. FARGHER, JR. (U.S. Navy, Cherry Point, NC) IN: AIAA/ADPA/NSIA National Total Quality Management Symposium, 1st, Denver, CO, Nov. 1-3, 1989, Technical Papers. Washington, DC, American Institute of Aeronautics and Astronautics, 1989, p. 142-147. (AIAA PAPER 89-3212)

The Naval Aviation Depot in North Carolina has been recognized by the federal government as a quality improvement prototype. This quality improvement program has provided: (1) the implementation of the strategic planning process, (2) performance measurement using a 'home grown' manufacturing resource planning system, (3) substantial advances in management accounting and cost control, (4) quality of work and work life, and (5) productivity gain sharing, as well as other productivity enhancement programs. The cornerstone has been the adoption of a philosophy incorporating total quality management and statistical process control. R.E.P.

The TQM program designed to meet the DOD management initiative of continuously improving performance at every level is examined. The keys to a successful TQM program are: (1) top management support, (2) employee commitment, (3) continued improvement activities, (4) supplier involvement, and (5) customer involvement. The role of management and employees in TQM is discussed. An award program, the TQM cycle, and concurrent engineering are considered. I.F.

REVISITING THE MEANING OF 'WORK' IN A TQM ENVIRONMENT

JEROME R. PIKULINSKI (General Dynamics Corp., Fort Worth, TX) IN: AIAA/ADPA/NSIA National Total Quality Management Symposium, 1st, Denver, CO, Nov. 1-3, 1989, Technical Papers. Washington, DC, American Institute of Aeronautics and Astronautics, 1989, p. 333-338. refs (AIAA PAPER 89-3653) Copyright

This paper reviews and discusses the applicability of selected personnel management theories to the Department of Defense objective of creating a 'Total Quality Management' environment within the operations of its defense contractors and their suppliers. The materials selected for review show that management has a basic behavioral requirement to create and maintain cooperation. Conversely, workers have a need to achieve motivational states characterized by satisfaction. Motivating workers to higher states of performance may interfere with workers' satisfactions. Various methods may be used to develop cooperation. Demographic factors, technological trends, and increasing desires and needs of workers to control their own work performance are increasing the complexity of managing worker performance. A return to basic management concepts is indicated. Author

IMPLEMENTING TQM IN THE AIR FORCE'S SPACE BASED INTERCEPTOR PROGRAM OFFICE

The Space Based Interceptor (SBI) program is the pilot program for TQM. The goal of the program is to provide quality, cost effective products to customers. The use of work groups, training sessions, a newsletter, and rain storming sessions to implement TQM is described. The importance of a good relationship between the USAF and the contractors in order to implement TQM is discussed. The SBI program is in the demonstration/validation phase; problems associated with using TQM in this phase are considered. It is noted that the use of TQM in the SBI program has resulted in a potential \$10-20 million savings in the SBI Flight Experiment and a reduction of \$30 million in SBI software development. I.F.

TOTAL QUALITY MANAGEMENT IMPROVES COMBAT SUPPORT TRAINING

ARTHUR S. KUBO (BDM International, Inc., McLean, VA) IN: AIAA/ADPA/NSIA National Total Quality Management Symposium, 1st, Denver, CO, Nov. 1-3, 1989, Technical Papers. Washington, DC, American Institute of Aeronautics and Astronautics, 1989, p. 414-418. (AIAA PAPER 89-3699) Copyright

The USAF is using Continuous Process Improvement based on measurable standards to meet an operational requirement within severe time and resource constraints. The methodology is straightforward and is based on identifying the requirements, defining tasks and task standards, establishing what must be trained, measuring the results of training, and making midcourse corrections to improve training performance. This application of the well used Instructional System Development (ISD) methodology is not unique but demonstrates that Total Quality Management-Continuous Process Improvement (TQM-CPI) in combat support can be achieved based on process knowledge, focus on user requirements and performance measurement, and requirements-based training standards. This paper briefly reviews the origins of the DOD templates and their relationship to the industrial processes associated with material acquisition. The principal features of the TQM initiative are then summarized, with emphasis on the DOD and Navy interpretations currently being implemented. Focusing on the Navy material acquisition function, the templates and TQM are shown to represent an integrated approach which offers maximum benefit to both the government and industry. Some 'traps' in the DOD implementation of TQM are identified, along with some thoughts on how to escape. Author

Reliability and maintainability are discussed as subsets of the assurance sciences. Total Quality Management (TQM) covers all of the assurance sciences, with significant emphasis on the human and organizational systems underlying all production processes. When the Air Force Logistics Command initiated TQM, a number

of challenges had to be overcome to achieve the full potential of the program. These barriers included a lack of worker motivation, opposition of existing management, and lack of effective communication. I.E.

The management strategy of NASA-Marshall's CFD branch in support of space hardware development and code validation implements various elements of total quality management. The strategy encompasses (1) a teaming strategy which focuses on the most pertinent problem, (2) quick-turnaround analysis, (3) the evaluation of retrofitable design options through sensitivity analysis, and (4) coordination between the chief engineer and the hardware contractors. Advanced-technology concepts are being addressed via the definition of technology-development projects whose products are transferable to hardware programs and the integration of research activities with industry, government agencies, and universities, on the basis of the 'consortium' concept. TOTAL QUALITY MANAGEMENT: AN APPLICATION IN A RESEARCH AND DEVELOPMENT LABORATORY Final

In September 1988, the Air Force Human Resources Laboratory (AFHRL) took initial steps to set up a Total Quality Management (TQM) program in the Laboratory. The implementation procedure used was the Method for Generating Efficiency and Effectiveness Measures (MGEEM). This procedure focuses on satisfying customer requirements, identifying Key Result Areas (KRAs) and tracking progress in those KRAs through Mission Effectiveness Indicators. This report outlines how TQM was implemented in AFHRL, and describes the lessons learned in the process. Lessons learned address: TQM versus Total Quality Control (TQC), applying TQM in an R and D organization, sustaining TQM, process action teams, and the acceptance of MGEEM as a method for implementing TQM. The survey feedback intervention technique, the confrontation meeting, and work teams are recommended for establishing TQM in an R and D organization. The procedures allow both managers and workers to develop a sense of ownership in the TQM process. This in turn increases the likelihood of sustaining the program and insuring its long-term effectiveness.

TOTAL QUALITY MANAGEMENT: A RECIPE FOR SUCCESS Study Project

Total Quality Management (TQM) is a high level Department of Defense (DOD) initiative that is being touted as the primary management tool to force the fundamental cultural change in the way the DOD conducts business in the systems age. What is TQM. Where did it come from. What are its guiding principles. How has it been used. What successes can be attributed to TQM. How can it best be implemented. These questions along with many others are addressed and answered in this work. In addition, an appendix of popular quality improvement models for organizations, their processes, and their individuals is provided. It was concluded that the DOD must embrace the TQM philosophy

and proliferate its principles in order to maximize the return on defense budget dollars. This will require an enormous investment in education, training and time and an equally positive commitment by the DOD leadership to create a DOD wide organizational climate that will stimulate and perpetuate individual productivity enhancing contributions. This document describes a study of various models of Total Quality Management Resource Centers that have been established, and is intended to assist in the development of a design for a Department of Defense (DoD) TQM Resource Center. The Institute for Defense Analyses (IDA) surveyed eight organizations with TQM Resource Centers for their designs and operations. While a precise set of organizations models did not emerge from the data collected, three critical design issues did: the level of activity, the degree of centralization, and the philosophy of operation. Moreover, the data from the study did not argue for or against the establishment of a DoD TQM Resource Center, nor was IDA asked to make this determination. Although the organizations surveyed have successfully used TQM Resource Centers to improve quality, at least two organizations who were winners of the prestigious Baldrige Award for Quality did not invest in TQM Resource Centers. Further study is required by the DoD to determine whether a DoD TQM Resource Center is needed and who its customers would be. GRA

TOP QUALITY MANAGEMENT, RELIABILITY, AND MAINTAINABILITY: INSTITUTIONAL GOALS WITH BUILT IN BARRIERS

PHILIP B. AITKEN-CADE 1990 71 p

(AD-A230134) Avail: NTIS HC/MF A04 CSCL 05/1

Total quality management (TQM) has been heralded as the process that will finally cause a cultural change throughout government and industry to usher in a new era of continuously increasing quality. Since the system appears to be slow to react to the change in culture, there may be institutional impediments that are preventing the Air Force from achieving all that it can in reliability and maintainability (R and M) and TQM. However, the study concludes that there are no concrete institutional barriers preventing the Air Force from reaching the goal of TQM. There are only opportunities for senior leaders to demonstrate their commitment to the TQM program. All members of the Air Force and industry must work toward continuous improvement in all facets of the system and the senior leaders must set the pace. Industry has instituted various forms of TQM (after all, TQM is defined in many different ways) and does not need the Government to dictate implementation plans. The success of the Air Force TQM program will depend on the extent to which its senior leaders are prepared to apply the concept of KAIZEN - gradual, unending improvement, doing little things better; setting and achieving ever-higher standards. The evaluation of the implementation strategy reflected the Civil Service personnel perspective at the project level. The external and internal environments at MSFC were analyzed for their effects on the ASRM TQM strategy. Organizational forms, cultures, management systems, problem solving techniques, and training were assessed for their influence on the implementation strategy. The influence of ASRM's effort was assessed relative to its impact on mature projects as well as future projects at MSFC. Author

A plan is described for the implementation of the Kansas Quality Improvement Network (KQIN). Objectives include providing a support system for business organizations initiating Total Quality Management (TQM) programs, raising the awareness of TQM and working with Kansas educational institutions to both update their curricula in the TQM area and to implement TQM techniques in their operations. The KQIN plan would allow Kansas to become more competitive with other Midwestern states that have already implemented quality improvement networks. Author

The total quality management program at Harris Corporation as a structured, orderly, and systematic approach to continuous improvement is described. As an integral part of the plan, specific goals for improvement of quality, timeliness, and cost performance

get a high level of visibility and attention throughout the organization. Management teams at each level work on problems that only they can solve. Once it is clearly understood where to go through strategic planning, the next step is to define the best way to get there. It is indicated that all of the processes of the business must be well defined and optimized for total organizational effectiveness and efficiency. R.E.P.

Achieving total quality management is a mind set that often requires a culture change. When it is achieved, the overwhelming priority of the organization is to always meet the agreed upon expectations of both internal and external customers. By-products of this achievement are elimination of waste, increased productivity, reduced costs, and reduced cycle time. Total quality management and the quality planning process as practiced by Olin Corporation are described, along with two examples of this process at work. R.E.P.

Total quality management (TQM) at General Dynamics is defined as a leadership philosophy that creates a working environment which promotes teamwork, trust, and the quest for continuous improvement. To demonstrate that management was serious about TQM it was necessary for the total organization to be involved. For total involvement, each level had to realize what it needed to know and do, and the process would only be sustained if a supporting structure was put in place. With that realization, an approach to assuring long-term continual success was initiated. Long-range benefits are anticipated through this approach of establishing strategic and operational goals that include: improved internal and external customer relations, improved processes that can support people, and improved attitude and output of employees at all levels. The path that Textron Lycoming is taking to achieve a culture of continuous improvement is discussed. A historical perspective illustrates the growing production requirements that resulted in the evolution of the total quality management (TQM) concept. The management team led a strategy to make step-function improvements in process technology and the effectiveness of the workforce in conjunction with assistance provided by the government. This joint effort embodied the basic principles of TQM through the use of quantitative measures and participation of the involved users to continually improve the specific product or service. These changes in technology and human resource skills have allowed significant improvements over the past several years. R.E.P.

At a large manufacturing facility TQM was used as the quality component of a Just-in-Time (JIT) cycle time management system. TQM was also introduced to nonproduction staff and to vendors, resulting in efficiencies and subsequent reduction in the cost of quality. Use of a single quality method throughout an organization avoids confusion and increases the power of all other productivity and efficiency improvement programs. Author

(AIAA PAPER 89-5052)

Criteria for the management of military software development and 'maintenance' (i.e., postdevelopment support to correct errors and improve performance) are proposed. The first main recommendation is that software development be subjected to the rules of robust design, including well-defined requirements, a systems-design approach, an organized independent architecture, and precise readable language. Robust design aims to minimize the need for modification and yet facilitate modification if it is required. The second recommendation is that adequate software processes be maintained by management, including a well defined methodology and policies, disciplined and repeatable processes, development and support tools, and planning and coordination. Also stressed is the need for continuous improvement of the management process itself, with consistent application of metrics to measure the performance of the software and the software-maintenance system. The key ingredient to any successful TQM program is top management commitment and involvement. The early top management involvement reflects itself in a series of goals and visions for the organization. From these broad guidelines, awareness training of personnel can take place, followed by a selected level of skills training associated with the process of improvement and changing the culture of the organization. Management training must also be considered to include continuous improvement as another tool in the manager's kit of approaches to the business environment. To track the success of the program, it is appropriate that a series of measurements be determined reflecting the results of the teams pursuing process improvements. To maintain and coordinate the program, the issue of a responsible person or executive in charge is also appropriate. Following a series of early successes, most programs will tend to level out or even drop in their effectiveness. It is necessary to recognize that TQM requires certain planning for the next level of attainment and the long term infusion of TQM into the culture. Author

The authors discuss the need for an enterprise to begin the development of a TQM (total quality management) process by better understanding its structures, functions, and performance in the context of a total/integrated operation. From this knowledge-base the enterprise can set objectives, define strategies, and plan an effective application of the TQM process and the use of resources that match an enterprise's strengths and weaknesses. The methodology, techniques, and tools for analyzing, planning, and changing management that empower an enterprise to effectively apply TQM are presented and discussed. It is noted that when planning and developing a new enterprise special care should be taken to design-in TQM. I.E.

A90-30774# AFLC TOTAL QUALITY MANAGEMENT CORE EDUCATION AND TRAINING DEVELOPMENT

STEVE D. DOHERTY (USAF, Logistics Command, Wright-Patterson AFB, OH) IN: NAECON 89; Proceedings of the IEEE National Aerospace and Electronics Conference, Dayton, OH, May 22-26, 1989. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1989, p. 1480-1482.

The USAF Logistics Command (AFLC) has been implementing total-quality-management (TQM) philosophy since October 1987. A major concern, however, for every manager and supervisor is whether or not personnel are being adequately trained in TQM principles and disciplines. In looking after this concern, there is a tendency to assume that training is the proper solution for every problem. When not valid, this assumption results in wasted training effort. The tendency is to request more training than needed, thus causing overtraining and a waste of training resources. The author examines how AFLC can design an adequate, yet efficient quality training program and avoid the traps just indicated. He

presents the AFLC education and training development model and schedule of the core curriculum development needed to ensure continuation of the AFLC quality revolution. I.E.

The planning for the Peacekeeper Instrumentation and Flight Safety System (IFSS) shows how teams were formed at each level of the organization as a vehicle for empowerment, and how this increased employee involvement is the foundation for continuously improved performance. As performance improvement initiatives reach fruition in an empowered environment, they provide leverage for greater accomplishments. Quality, cost, and schedule performance were improved through the implementation of a total quality management program. R.E.P.

Total quality management (TQM) focused on human resources, the benefits that can be realized if TQM is applied, and some of the current problems facing management without TQM are defined. Some methods that can be used to accomplish better relationships between supervisors/managers and employees with TQM are presented. It is suggested that the future success of an organization is in the success of its people, and that TQM of the human resource can make that success happen. R.E.P.

The application of Total Quality Management (TQM) methods in an aerospace development program is briefly characterized. The approach involves the formation of 8-12-member Product Development Teams; the members have different areas of expertise but all receive extensive training in such TQM skills as quality awareness and improvement, process management, statistical process control, Taguchi methods, team leadership, and departmental task analysis. The teams are organized before proposals are submitted, when possible, and are responsible for requirements development, design, fabrication, test, delivery and postdelivery support of the specified product. The McDonnell Aircraft Company's interaction with the Aeronautical and Astronautical Engineering program at the University of Illinois is considered. Seven two-hour seminars in aircraft configuration design along with the introduction of a graduate-level aircraft design course are described, and focus is placed on processes, products, and tools as well as design drivers, aerodynamic considerations, and propulsion integration issues. Aircraft structures and systems are outlined, and careers in design are discussed. An experiment is described, in which Taguchi-parameter design techniques are applied to the fusion of several design parameters that make up aircraft specifications. With the goal of generating an aircraft with multimission capabilities, five designs are produced by the class, each with a different mission emphasis.

DEVELOPMENT AND IMPLEMENTATION OF A FORMAL TRAINING PROGRAM FOR CONCURRENT ENGINEERING IN AN AEROSPACE ENVIRONMENT

In the highly competitive aerospace industry, innovative approaches to quality improvement such as Total Quality Management (TQM) and one of its key elements, concurrent engineering (CE), are critical for survival. An effective training and education program is essential for a smooth transition to a concurrent engineering environment. The methodology and approach to instructional design used at McDonnell Douglas Space Systems Company (MDSSC) led to a concurrent engineering training program that stimulates interest in using concurrent engineering principles and tools. Other aerospace companies can adapt this training program to fit their specific needs.

Specific concurrent engineering practices vary among organizations. There are, however, various management practices that appear to work well for most organizations. This paper presents the reader with specific, useful examples from several defense contractors illustrating how multifunctional concurrent engineering teams are being organized and managed and how concurrent

engineering team meetings are conducted and supported. The types of computer support that could be used to enhance the efficiency and effectiveness of concurrent engineering team meetings are identified. The general findings are that there exists a direct relationship between total quality management (TQM) and concurrent engineering, and that many applications of computer-aided group problem solving are possible and practical today for the concurrent engineering team meetings. Areas identified for additional research are the documentation of the decision process and rationale during the product and process definition, the capturing of lessons learned during the implementation of concurrent engineering, and the performance evaluation and training of team members.

In the 1990s and beyond, material suppliers will need to extend their 'customer-horizon' in order to market specialty materials in a globally competitive environment. The supplier will need to be capable of timely, demand-driven research and development of specialty materials for an expanding product-base. Further, the material supplier will become a partner in the 'demand-driven' engineering of specialty materials. The supplier will become more involved in addressing the needs of the customer at all levels in the chain. That is, consideration of product requirements, product processing requirements, maintenance and retirement requirements - requirements traversing the complete life-cycle of the product and the material from which it is made. Ultimately, the supplier must have an organization that can interact with the customer(s) at each product level.

This paper reports on the usefulness of data transformation in a proper application of the 'Taguchi method' for off-line quality control. With the joint aim of establishing a meaningful measure of performance variability and reducing the risk of incorrectly assuming no interactions in the performance model, a simple method of choosing appropriate data transformations is presented. This provides the basis for a suggested general procedure for carrying out Taguchi analyses. The technique is assessed by considering how it performs on data taken from previously published applications of the Taguchi method. Author

In the course of his career, Genichi Taguchi has emphasized the importance of statistically-designed experiments for improving the quality of the engineering design of products and processes. Attention is presently given to Taguchi's choice of statistical methods for solving such design problems; since these methods have frequently been found to be statistically inefficient and cumbersome, simpler and more modern data analysis methods are presently recommended. The rendering of products insensitive to component variation, the minimization of variations about a target value, and the method of accumulation analysis, are addressed. O.C.

The advantages and disadvantages of the Taguchi orthogonal tables are evaluated with attention to their involvement of fractional factorials, in order to furnish a framework for the elucidation of an alternative approach whose development by D. Shainin began in the U.S. in 1952. It is noted that only 16 tests in a properly conducted full factorial test plan for two, three, or four variables are necessary for avoidance of spurious conclusion. The alternative variable-search pattern strategy, preceded by such objective clue-generating methods as 'multi-vary charting', can substantially improve the cost-effectiveness of the discovery of root-cause controlling variables through the use of five or more candidate factors; a sequential, rather than random, sequence of interchanging levels is employed. The ability of the Taguchi technique to accurately characterize and successfully optimize complicated multiresponse processes with the minimum of experiments is demonstrated, provided that simple statistical techniques which can ensure valid and definitive results, are used. The usefulness of suitable data-transformations is noted, and a systematic procedure for establishing the optimal operating conditions and for carrying out confirmatory experiments is suggested. For the particular case detailed in this paper (which is typical of multiresponse processes) the Taguchi technique achieved an improvement in uniformity of a factor of 2, together with optimized process control. A new application of Taguchi Methods - in the applied research and exploratory development stages of a product - is presented. Such a use implies prior knowledge of performance requirements for future products and of the expected ranges of product parameter levels. The usefulness of the resulting database justifies this application; it is a most efficient means of conducting research and development programs around an entire family of products. Many future system designs can be developed and transferred to production using the database from only one series of Taguchi experiments. With this approach extraordinarily large cost savings are realized over the traditional practice of having to conduct individual research or exploratory development projects for each new product requirement. Applying this approach to pyrotechnic defense products, the authors have found that significant savings in costs, time and personnel can be realized. Author

COMBINING TAGUCHI AND RESPONSE SURFACE PHILOSOPHIES - A DUAL RESPONSE APPROACH

It is shown that one can achieve the primary goal of the Taguchi philosophy of obtaining a target condition on the mean, while minimizing the variance, within a response surface methodologies framework. Through a parameter design method and the use of signal-to-noise ratios, Taguchi (1986) has approached the problem of considering both the mean and the variance of the characteristic of interest in the field of industrial statistics. This paper views both the mean and the variance as responses of interest. In this perspective, the dual response approach developed by Myers and Carter (1973) provides a more rigorous statistical methodology for achieving some target for the mean while also achieving some target for the variance. This approach is reviewed and applied to the Taguchi problem. An experiment studying the effect of speed, pressure, and distance upon a printing machine's ability to apply coloring inks on package labels is given as an example and illustrates the reasonability of the dual response approach.

QUALITY FUNCTION DEPLOYMENT - A COMPREHENSIVE TOOL FOR PLANNING AND DEVELOPMENT

MICHAEL A. SCHUBERT (General Motors Corp., Dayton, OH) IN: NAECON 89; Proceedings of the IEEE National Aerospace and Electronics Conference, Dayton, OH, May 22-26, 1989. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1989, p. 1498-1503. refs Copyright

The central theme of the quality function deployment (QFD) methodology is identification of the 'voice of the customer' and using this voice as a basis for planning and development. This methodology has been applied successfully to products, services,

and software. The QFD methodology and how this methodology furnishes a planning framework are examined. A brief history of QFD introduction and growth both in Japan and in the US is included. In addition, how QFD fits with or relates to systems engineering, design reviews, value analysis, and product process planning and analysis is discussed. I.E.

STATISTICAL PROCESS CONTROL: REQUIREMENTS FOR SUCCESS - M.4 DESIGN QUALITY - PRODUCIBILITY AND PROCESS OPTIMIZATION

THOMAS J. FIESSINGER (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: NAECON 89; Proceedings of the IEEE National Aerospace and Electronics Conference, Dayton, OH, May 22-26, 1989. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1989, p. 1509-1515.

The author describes the implementation of statistical process control (SPC) from a manager's perspective. He lays the groundwork for SPC both in terms of design and manufacturing, sets the stage for startup, and discusses what critical elements must be present for success. SPC's essential role in design and its relationship with manufacturing are thoroughly detailed. Traditional problem areas of SPC are covered including what process or product parameters need to be controlled, what charting techniques should be used, and how requirements should be levied on suppliers. A few case studies are presented on the successes and failures of several companies' efforts to start an SPC program. Finally, the real and long-term benefits of SPC, including increased communications among all departments, better insights into cost-reduction opportunities, variability-reduction opportunities, continuous quality improvement, and a more effective design-manufacturing interface, are addressed to show why this methodology has great potential for success in today's extremely competitive global environment. SYSTEM DESIGN WITH QUALITY ENGINEERING

ED POHL, DAVE ROBINSON, and JEFF JACOBS (USAF, Institute of Technology, Wright-Patterson AFB, OH) IN: NAECON 89; Proceedings of the IEEE National Aerospace and Electronics Conference, Dayton, OH, May 22-26, 1989. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1989, p. 1524-1528. refs

The authors discuss the use of quality function deployment during the conceptual design of a kinesthetically controlled vehicle. Specifically, the techniques were used to increase the inherent dynamic stability of the vehicle through proper placement of critical components. The resulting design was robust to operator size and skill level as well as on-board weapon system and external-environment-induced oscillations. In the present work, particular emphasis is placed on parameter design, the goal of which is to take an organized approach to design tradeoffs so that the overall system performance is maximized while keeping costs at a minimum. Cost is incurred whenever the desired performance is not achieved. The identification of all applicable parameters that affect the performance of the system is discussed. The parameters fall into two broad classes: design parameters and noise parameters. I.E.

The author shows how SPC (statistical process control) techniques can be used to improve the quality and productivity of large-scale software development. They describe the major elements of a SPC system and consider the use of SPC in

manufacturing. General criteria for selecting SPC candidates are presented. The steps required to apply SPC to software development activities are described, and activities that appear to be particularly good SPC candidates are identified. Major advantages of the SPC approach to software development are summarized. I.E.

COST OF QUALITY AS A BASELINE FOR TOTAL QUALITY MANAGEMENT (TQM) IMPLEMENTATION

WILLIAM J. GRUNENWALD (ADM Consultants, Inc., Fairborn, OH) IN: NAECON 89; Proceedings of the IEEE National Aerospace and Electronics Conference, Dayton, OH, May 22-26, 1989. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1989, p. 1611-1613.

The author presents the concept of using cost of quality as an effective tool in implementation of a total-quality-management (TQM) approach. The essence of TQM is defined as the search for opportunities for improvement. TQM implementation and the need for baseline are discussed. The requirements for establishing a baseline are discussed, with the focus on cost of quality. The use of the cost-of-quality baseline is detailed, with emphasis on its continuous value. The establishment of certain 'universal truths' which address the use of TQM and cost of quality in a given environment is examined. I.E.

A control chart designed especially to provide statistical process control (SPC) for short production runs has been developed. This chart allows the operator to plot different part numbers on the same chart, thus considerably reducing the required amount of paperwork and time spent in looking for the right chart. In addition, since all the information concerning the process is now on the same chart, any time-related changes in the process can be more easily detected. With some of the more advanced short-run techniques, even part numbers with different characteristics can be plotted on the same chart. Multiple process streams, subgroups with different sample sizes, and flexible machining centers (with multiple characteristics per part) can all be charted together. I.E.

The 'back to basics' approach supported by total quality management (TQM) in the acquisition process is presented. To demonstrate the conceptual relationships defined by the reliability and maintainability (R&M) 2000 process and TQM, an R&M quality team concept is used to design systems that break less and are easily repaired without a costly and complex support infrastructure. The method has been used successfully in the design of the C-17A airlifter. The requirements include, as a corollary to performance, the aspects of mobility, survivability, manpower, and cost limitations. These added factors demand that the system acquisition process include plans to focus on R&M and identify the necessary TQM initiatives to improve the weapon systems' built-in R&M. R.E.P.

SHORT-TERM BENEFITS OF CONCURRENT ENGINEERING

The focus of the DOD on total quality management has motivated many companies to evaluate the advantages of incorporating engineering techniques into their design and production organizations. Concurrent engineering has been defined as a systematic approach to the integrated, concurrent design of products and their related processes, including manufacture and support. This approach is intended to cause the developers, from the onset, to consider all elements of the product life cycle from conception through disposal, including quality, cost, schedule, and user requirements. When applying concurrent engineering techniques, it may be necessary to wait a long time. However, while waiting to realize the long-term benefits, the manager can realize many short-term benefits from concurrent engineering. R.E.P.

The paper examines a key concurrent engineering construct involving the use of multifunction teams that employ quality function deployment to enhance the definition of a solid set of product and process requirements based on the wishes of the customer. Aerojet has been tailoring concurrent engineering constructs over the past year and has chosen SPIRIT 111 as a pilot for testing these new constructs because of the potential benefits in reducing cost and improving schedule while providing a state-of-the-art high quality product. The multifunction teams address the issues that exist, including thermal, mechanical, electrical, environmental, performance, modularity, and interchangeability. Lessons learned that may help those considering concurrent engineering and quality function deployment for prototypes or production are summarized. R.E.P.

Product improvement has proven to be an excellent way of introducing total quality management (TQM) because of the commonality of principles, in that both require customer-defined quality, employee involvement, and continuous improvement. The establishment of a TQM organization structure that separates the 'process improvement' from 'process ownership' has insured that a high degree of objectivity is maintained in the process improvement. Involvement by all levels of management in prioritizing process improvement efforts and approving team recommendations has guaranteed the necessary support for process improvement teams (and by extension TQM) to be successful. Concurrent engineering requires rapid and accurate communication between a variety of specialists and encourages the use of quantitative experiments early in the design process. These requirements will lead to increased commitments to developing and maintaining formal models of the system throughout the system life cycle. The corresponding challenge for concurrent engineering tool builders is providing a totally integrated environment. Each specialist can then see a view of the common model of the system and can evaluate the system model in context at any stage of development. Tool developers are responding to this challenge by beginning to integrate the tools needed for concurrent engineering. R.E.P.

The new model of assuring quality is one that gives added responsibilities to the developers and different ones to the classical quality assurance (QA) organizations. It is one in which 'quality' is not detached from the products and processes by partitioning off inspections and checks as 'quality' activities, but rather becomes an integral part of the product and processes. QA's role is shifted to one of 'process integrity' wherein analysis, advice, and consultation are objectively provided to help improve and

strengthen the processes. In addition, QA would play a major role in tailoring the required regulations and standards so that they benefit the product development. R.E.P.

MAKING TQM WORK THROUGH THE VARIABILITY REDUCTION PROCESS

The Variability Reduction Process (VRP) is a means of improving product performance and reliability while reducing time and cost. The best way to reduce the effects of variation is to eliminate the causes of variation or by developing designs which are insensitive to variation. Employing statistical process control (SPC) and having capable manufacturing process is good but not sufficient. Often, the causes of variability are difficult to remove or control. It is important to develop robust production processes that are insensitive to the manufacturing environment, and robust designs that are insensitive to the operational environment. For the concepts of VRP to succeed, management must create a supportive atmosphere for continuous improvement. Author

Statistical Methods for Production Improvement (SMPI), the bridge between the Total Quality Management (TQM) philosophy and continuous improvement in production areas, was begun at Martin Marietta Electronic Systems in September 1988. The program's aim was to find new ways to improve yield, reduce rework, and identify areas of potential improvement in a final assembly and test-oriented facility. SMPI provides an approach to evaluating technical and cost alternatives in a preemptive and disciplined manner, using long-standing statistical techniques and Kepner-Tregoe problem-solving guidelines. This approach has proved highly successful at Martin Marietta Electronic Systems and has resulted in increased yield, significant cost savings, and reduction in product build time. This paper discusses the methodology for applying statistical tools in the production environment and focuses on phases of project identification, prioritizing, selection, analysis, and implementation. This paper describes a failure-modes investigation approach that successfully solved a series of failures that were occurring in rocket motor cases during manufacture. Because of the materials used in fabricating the case, it was assumed that moisture was the principal cause of the observed failure modes; however, a combination of factors was found to be at fault, primarily through the successful incorporation of the experimental design and analysis technique offered by Taguchi methods. This technique uses orthogonal arrays, analysis of variance, and signal-to-noise analysis in a manner that permitted the successful completion of this failure investigation with only 63 designed experiments instead of the more than 13,000 that would have been required using full factorial arrays. The result: no recurrence of the failure modes that were causing a 12-percent loss rate during case manufacture and the avoidance of major capital expenditures considered necessary to solve the problems. Product design is often optimized using finite element analysis with computer aided design. This is usually done by changing factors in an unstructured manner, one-factor-at-a-time. The optimum design obtained in this way is often sensitive to manufacturing variation. This paper demonstrates a methodology for using Taguchi Methods to explore the finite element model space in a structured manner which is efficient and economic. Furthermore, the optimum is desensitized to factors such as manufacturing variation. Author

THE IMPACT OF TOTAL QUALITY MANAGEMENT (TQM) AND CONCURRENT ENGINEERING ON THE AIRCRAFT DESIGN PROCESS

DANIEL P. SCHRAGE (Georgia Institute of Technology, Atlanta) IN: Vertical Lift Aircraft Design Conference, San Francisco, CA, Jan. 17-19, 1990, Proceedings. Alexandria, VA, American Helicopter Society, 1990, 21 p. refs

In the aerospace industry results from a recent American Institute of Aeronautics and Astronautics (AIAA) quality survey showed a broad-based recognition that quality is a major engineering issue, that basic systems engineering processes as presently practiced need to be improved, that there are significant shortfalls in engineering skills and basic engineering education needed to support quality improvement, and that AIAA as a professional society should get more involved in this issue. This paper will attempt to put in perspective the impact of TQM and concurrent engineering on the aircraft design process and review

some of the essential features for successful incorporation.

TAGUCHI METHODS IN CONCEPTUAL DESIGN FOR LIFE CYCLE COST

S. A. INGALLS, C. L. MARTIN, W. MAYVILLE, J. E. ROGAN, and M. SHUBERT (Georgia Institute of Technology, Atlanta) AIAA, AHS, and ASEE, Aircraft Design, Systems and Operations Conference, Dayton, OH, Sept. 17-19, 1990. 8 p. refs (AIAA PAPER 90-3222) Copyright

Parametric life cycle cost (LCC) models may be utilized in conceptual design to calculate LCC as a basis for comparison of diverse configuration, production, and support concepts. Cases from conceptual design sizing are employed to explain the basic concepts in Taguchi methodologies. Taguchi methods are used in two conceptual design studies to evaluate the effect of conceptual design choices on the expected value and variability in LCC. It is concluded that the curve-fitting approach to life cycle cost estimation wastes valuable data concerning the relationship between design options and the variability in LCC. Jaynes maximum entropy principle and Bayes theorem are proposed as alternative techniques. While Taguchi's methodologies and philosophy seem to be a useful tool for bringing downstream LCC into early conceptual design, a more sophisticated approach to the utilization of statistical procedures in aircraft design is required to achieve these benefits. DISTRIBUTED CONCURRENT ENGINEERING COMPUTATION ON A NETWORK OF MICROCOMPUTERS

J. B. MCINNIS and W. H. ELMARAGHY (Western Ontario, University, London, Canada) Engineering with Computers (ISSN 0177-0667), vol. 6, Summer 1990, p. 145-152. Research supported by the Ontario's Premier Council University Research Incentive Fund. refs Copyright

A programming method that facilitates interworkstation communications on a local area network (LAN) of microcomputers has been developed. Communications are managed using a set of common access status and data files, which are written to and read from the file server hard disk. Use of this programming method permits the work load associated with large computational problems to be distributed to various workstations connected to a LAN for concurrent processing, and has resulted in substantial solution time savings in problems that have been run. The paper describes the basic principles underlying the distributed processing technique that was developed and presents several example problems that were run to test the technique and develop benchmark results for a particular LAN configuration. A SIMPLE METHOD FOR OBTAINING RESOLUTION IV DESIGNS FOR USE WITH TAGUCHI'S ORTHOGONAL ARRAYS

KIMBALL E. BULLINGTON (Micro Motion, Inc., Boulder, CO), JAMES N. HOOL, and SAEED MAGHSOODLOO (Auburn University, AL) Journal of Quality Technology (ISSN 0022-4065), vol. 22, Oct. 1990, p. 260-264. refs Copyright

A concern expressed in the literature about Taguchi's methods for experimental design is that many such designs are not optimal in the sense that they are not the maximum resolution possible for a given number of main effects and array size. This paper addresses that concern by demonstrating that Taguchi base-two orthogonal arrays consist of fold-over designs and the two-factor products of fold-overs. The result of recognizing this characteristic is a simple method for guaranteeing resolution IV Taguchi designs. This allows the experimenter to retain the ease of design that using Taguchi's orthogonal arrays affords, and at the same time avoid aliasing main effects with two-factor interactions. Author

The integration of computerized risk management into a system engineering and program management processes is discussed. Program management using Total Quality Management (TQM) is reviewed, and the ways that such management can be improved by computerized risk management are shown using the BDM Risk Analysis and Management System (BRAMS). The application of BRAMS to assess the risk of achieving launch on schedule of a hypothetical satellite system is examined. The role of TQM in system engineering management is discussed. C.D.

ALS - A UNIQUE DESIGN APPROACH

ROGER A. CHAMBERLAIN (Martin Marietta Astronautics Group, Denver, CO) AIAA, Space Programs and Technologies Conference, Huntsville, AL, Sept. 25-27, 1990. 12 p. (AIAA PAPER 90-3897)

An advanced launch system (ALS), which is intended to be flexible and to deliver a wide range of payloads at a reduced cost, is discussed. The ALS concept also features total quality management, modular subsystems, standardized interfaces, standardized missions, and off-line payload encapsulation. The technological improvements include manufacturing of dry structures, use of composite materials, adaptive guidance and control systems, and laser-initiated radar systems. The operational improvements range from paperless management, to rocket engine leak detection devices and automated ground operations. B.P.

NASA Space Station Program Office, Reston, VA. SPACE STATION FREEDOM - CONFIGURATION MANAGEMENT APPROACH TO SUPPORTING CONCURRENT ENGINEERING AND TOTAL QUALITY MANAGEMENT

RAYMOND B. GAVERT (NASA, Space Station Freedom Program Office, Reston, VA) IN: Space Logistics Symposium, 3rd, Colorado Springs, CO, Apr. 30-May 2, 1990, Proceedings. Huntsville, AL, Society of Logistics Engineers, 1990, 13 p. refs Copyright

Some experiences of NASA configuration management in providing concurrent engineering support to the Space Station Freedom program for the achievement of life cycle benefits and total quality are discussed. Three change decision experiences involving tracing requirements and automated information systems of the electrical power system are described. The potential benefits of concurrent engineering and total quality management include improved operational effectiveness, reduced logistics and support requirements, prevention of schedule slippages, and life cycle cost savings. It is shown how configuration management can influence the benefits attained through disciplined approaches and innovations that compel consideration of all the technical elements of engineering and quality factors that apply to the program development, transition to operations and in operations. Configuration management experiences involving the Space Station program's tiered management structure, the work package contractors, international partners, and the participating NASA centers are discussed. THE POTENTIAL FOR CONCURRENT ENGINEERING IN SPACE SYSTEMS DEVELOPMENT - INDUSTRY PERSPECTIVE

ERICH HAUSNER (TRW Space and Technology Group, Redondo Beach, CA) IN: Space Logistics Symposium, 3rd, Colorado Springs, CO, Apr. 30-May 2, 1990, Proceedings. Huntsville, AL, Society of Logistics Engineers, 1990, 4 p.

It is shown how mutually beneficial linkage may be established through shared requirements development and how concurrent engineering (CE) may be accomplished by a contractor. CE offers

advantages not only to industry as a discipline to enhance system design, but also to government as a discipline to identify concise, clear and meaningful system requirements. If the requirements definition process is sufficiently rigorous and compatible, there should be a smooth transition between government and contractor requirements analyses, generation and implementation. It is concluded that with the current declining defense budgets and rising costs and complexities of weapons systems, CE offers a streamlined process of requirements definition that benefits both industry and government. APPLYING QFD TECHNIQUES TO AEROSPACE SUPPORTABILITY

RAMON CHI (Rockwell International Corp., Downey, CA) IN: Space Logistics Symposium, 3rd, Colorado Springs, CO, Apr. 30-May 2, 1990, Proceedings. Huntsville, AL, Society of Logistics Engineers, 1990, 12 p.

Quality function deployment (QFD) is described, and it is shown how beneficial it can be to the logistics and supportability development process. QFD procedures are illustrated using a hypothetical aerospace design. QFD is defined as a technique or discipline that provides a means of translating the user's requirements into the appropriate technical requirements at each stage from research and development through engineering and production, and finally to product deployment and marketing. The goal is to ensure a competitive edge by lowering the cost, improving the quality, and reducing the product's development time. R.E.P.

A process is presented that integrates quality function development (QFD) and designed experiments into one continuous process of robust design that ensures close mapping of requirements into parametric design. The process emphasizes the necessity to decompose the QFD to the level of critical parts and thereby facilitates the transition to parameter design by choosing control factors from the group of critical parts. In addition, this process necessitates close teamwork between designers and management and a firm commitment to the process, which may require abandonment of established design paradigms. R.E.P.

In order to reduce the number of electrical connector problems on the Apache helicopter, Taguchi methods are used for identifying the factors that contribute to a good quality connection. Bad wire-to-pin crimps are identified as a major problem, a work group is formed with people from various disciplines that the problem affects, the problem is further defined by the group, and experimental control factors including crimp type and length, strip length, window centering, operators, and wire vendors are identified. Experimental procedures are laid out and conducted, and the experimental data is then analyzed. Crimp depth is identified as the major contributor to the strength of a crimped connection, while it is observed that undercrimping yields the highest pull-strength response and tolerance to different wire brands. A system engineering methodology is described which enables users, particularly NASA and DOD, to accommodate changing needs; incorporate emerging technologies; identify, quantify, and manage system risks; manage evolving functional requirements; track the changing environment; and reduce system life-cycle costs. The approach is a concurrent, dynamic one which starts by constructing a performance model defining the required system functions and the interrelationships. A detailed probabilistic risk assessment of the system elements and their interrelationships is

performed, and quantitative analysis of the reliability and maintainability of an engineering system allows its different technical and process failure modes to be identified and their probabilities to be computed. Decision makers can choose technical solutions that maximize an objective function and minimize the probability of failure under resource constraints. C.D.

The process capability indices $C(p)$ and $C(pk)$ are widely used to provide unitless measures of process potential and performance. These indices do not adequately address the issue of process centering. An alternative definition of $C(p)$ advocated by Taguchi (1985, 1986) addresses this issue directly. Later authors introduced the name $C(pm)$ for the Taguchi index and examined statistical properties of an inefficient estimator under the assumption that the process mean coincides with the target value. The present paper presents statistical procedures based on the original Taguchi estimator which require no assumptions on the process mean. $C(pm)$ and $C(pk)$ are compared and contrasted to dispel the notion that $C(pk)$ measures process centering. The advisory committee to NASA on overall approaches for implementing the U.S. space program in the years ahead has concluded that Shuttle missions should only be flown when a human presence is necessary. It was noted that reducing the number of missions would extend the life of the existing fleet and retain the number of orbiters required at the presently planned four and any funding for a fifth orbiter should be utilized instead for the development of a new heavy lift launch vehicle. These recommendations have led to increased design proposals under the Advanced Launch Development (ADLP) Program such as the Shuttle C (cargo), an unmanned version that could orbit 100,000 to 150,000 lb for two- and three-engine versions, respectively, and would make maximum utilization of present Shuttle processing and pad facilities. Other concepts under investigation by ADLP include electromechanical actuators to replace hydraulic systems, advanced modular avionics and common avionics/payload interfaces, and laser-initiated ordnance for component separation and staging. It is noted that the drive to evolve a heavy lift system will fully employ the total quality management approach, with producibility and operability built into the system from the start. R.E.P.

The scope includes not only the traditional manufacturing and automation efforts, but also the large opportunity in the design functions. Considered gains in manufacturing have been achieved through the judicious use of automation, computer-integrated-

Second, formulate solution concepts that clearly map to the problem structure. The problems being encountered in avionics design are discussed. It is shown that a multifunctional design team the members of which all work from a common requirements source document could be a major step in implementing an effective solution. I.E.

The use of Taguchi methods for parameter design and tolerance design is well established. This paper describes a new application to qualification trials or type approval tests. The essential difference from the accepted use is that the purpose is to demonstrate performance when a product is subjected to internal or external noise. With a tolerance trial the aim is to find which sources of noise can be cost-effectively controlled. Two case-study examples are presented which show the value of the technique. The first shows how the measurements are used to provide one of the published performance specifications for a digital electronic product. The second reveals how an interaction between three environmental parameters took an analog electronic product out of specification. There is a discussion on the suitability of the technique for software testing and for reliability demonstrations. This includes comments on which arrays are most appropriate for which situation. A BETTER METHOD FOR VERIFYING PRODUCTION RELIABILITY

ANTHONY COPPOLA (USAF, Rome Air Development Center, Griffiss AFB, NY) Quality and Reliability Engineering International (ISSN 0748-8017), vol. 6, Sept.-Oct. 1990, p. 295-299. refs

Various schemes have been created for verifying that reliability is not degraded during production. These include the periodic performance of reliability tests during production, three versions of an all-equipment reliability test plan and Bayesian approaches. Each method has its drawbacks. The purpose of all of these is to verify that the production process is continuing to produce products of acceptable reliability, for which the long-existing tools of statistical process control are directly applicable and advantageous. A method of verifying production reliability based on the use of a control chart for failure rate is proposed as a better way than the current standards and alternatives discussed in this paper. LOW COST ROCKET MOTOR TECHNOLOGY PROGRAM

The low-cost rocket motor technology program demonstrated that low-cost booster rocket motors could indeed be produced to meet many requirements for ground-launch unmanned aerial vehicles (UAV) and other similar applications. The approach to this program was to design, develop, fabricate, and test a low-cost motor design using existing technology and component designs which, because of their extensive manufacture and use history, promote high quality and low cost. The program incorporated principles of total quality management, concurrent engineering, and, where applicable, Taguchi parameter optimization to further ruggedize demonstrated materials. The design incorporates low cost off-the-shelf proven materials and a minimum number of components to reduce the number of fabrication and processing operations. The simple grain and insuliner configurations led to a significant reduction in chemical processing and propellant casting steps. Three low-cost motors were fabricated and static fired. They met all predicted performance parameters and demonstrated the low-cost approach to booster rocket motor design. Author

The objectives of the Advanced Solid Rocket Motor (ASRM) Nozzle Program are to improve performance, reliability, and flight safety. A program has been implemented which will achieve the goal through application of the methods of Total Quality Management to develop a simpler, more robust design for the nozzle and its manufacturing processes. Substantial weight reductions have been achieved through the use of low-density carbon-cloth phenolic in the aft exit cone and a lighter weight flex seal. Subscale, prototype, and development and qualification motor tests will be used to develop and validate the materials, processes, and designs. Author

A number of company design engineering and development innovations in the F-22 Lightning II prototype are described to emphasize the concurrent engineering concept approach that was used. Early in the program it was decided to design the prototype aircraft as close to what would be proposed at engineering/manufacturing development (formerly, full-scale development) as possible. A large jump in developing an integrated avionics system was taken with all sensors and avionics tested in a 757 flying laboratory to complement ground testing. The engineering team relied heavily on its own concurrent engineering

The authors summarize some elements of the test program set (TPS) total quality management (TQM) challenge encountered in providing full organic support to the government for an avionics system. The major issues discussed include vertical testability, automatic test equipment (ATE) immaturity, and TPS maturation. The problems encountered, subsequent actions, and lessons learned are addressed. It is concluded that a TQM approach must be employed for the design implementation and development of a successful TPS throughout the life cycle of the TPS. I.E.

AIAA TECHNICAL COMMITTEE ON MULTIDISCIPLINARY DESIGN OPTIMIZATION (MDO) - WHITE PAPER ON CURRENT STATE OF THE ART

Washington, DC, American Institute of Aeronautics and Astronautics, Jan. 15, 1991, 51 p. refs

Multidisciplinary design optimization (MDO) is reviewed in terms of the need for technological integration, recent advances in the mathematically based MDO systems and methodologies, and directions for research and development. The use of MDO in the aerospace industry is first considered historically, and the multidisciplinary character of the design process is emphasized. Design considerations related to human interface and computing are set forth to underscore the essential nature of these aspects. In addressing the issues of aerospace design, the MDO approach relies primarily on sensitivity analyses and optimization methods. A list of ten characteristics of the concurrent engineering process is given, and each item is addressed in terms of the corresponding MDO contribution. MDO is essentially an environment in which

human, mathematics, and computer factors can be effectively combined to make sound design decisions. C.C.S.

Important technologies incorporated into the LHTEC T800 engine and the winning Boeing Sikorsky Comanche weapon system designs are addressed in detail. Both LHTEC and the Boeing Sikorsky team are taking advantage of advanced technologies, in conjunction with MANPRINT, total quality management, and concurrent engineering principles, to significantly improve producibility and supportability. This balanced approach of incorporating advanced technologies is considered to provide a quantum improvement in Comanche war fighting effectiveness, as compared with existing Army helicopter alternatives. Experiences of an Integrated Product Definition Team at McDonnell Aircraft Company are described. How a collocated multidisciplinary team focused on a particular product can produce a quality part in less time, eliminating downstream cost due to scrap and rework is shown. Supported by a Total Quality Management environment and given the proper tools, the team was tasked with providing a qualified manufacturer with all the necessary information to make a first time quality product. This information, in the form of a 'Build-To-Package', contained collaborated data from each discipline provided by different computer based tools. Configuration control and release of the data package presented the greatest challenge. A future solution for control and release of heterogeneous data is discussed.

This paper addresses the specific steps to integrate the product development process and the transition to a concurrent engineering environment at General Dynamics Space Systems Division. A survey of industry and government trends, corporate plans and division goals relating to concurrent engineering was conducted. An integrated product development process was developed and implemented on a pilot project. Performance metrics were taken to evaluate the effectiveness of these new processes. Substantial cost, schedule and quality benefits were achieved. Based on this success, twelve follow-on pathfinder concurrent engineering teams have since been implemented on three separate programs. A concurrent engineering training course has been developed. A management level implementation team has been formed to institutionalize concurrent engineering methods and ease the transition phase to an integrated concurrent engineering environment. Author

Concurrent engineering (CE) is described and examples of its implementation are presented to evaluate practical applications of CE. Management and quality requirements for CE are listed with considerations both internal and external to the engineering enterprise. A CE benchmarking matrix is presented for characteristics such as training, performance measurement, and budgets. The development of strategic and tactical plans is described, and attention is given to the implementation approach and other key issues. Also identified are the most important aspects of the CE process which include management commitment, formal training programs, multidisciplinary teamwork, integrated schedules, and supplier partnerships. CE is considered to be an effective managerial philosophy for improving productivity and quality.

This paper presents a concurrent engineering methodology described as structured design. The design methodology is characterized by early interaction of all product responsible disciplines, comprehensive definitization of product requirements, in-process design and development validation check points, and a closed-loop quality measurement and corrective action process. The effective interaction of engineering, manufacturing, and other product supporting disciplines has significantly improved the quality of design and has reduced overall product development cycle time. This paper will discuss the application of the methodology for designing electronic structures that yielded an 85-percent reduction of design engineering changes.

An aerospace company is implementing concurrent engineering teams on all programs. This paper describes a system and tools to continuously measure implementation progress and the impact of concurrent engineering. Two major measuring approaches were developed: (1) benchmarking matrices used by teams, programs, support divisions, and a concurrent engineering advisory team to measure the transition to a concurrent engineering environment, and (2) an array of effectiveness measures for each team and program in cycle time, quality, productivity, cost, and schedule. Many existing measures must be supplemented or modified in a new concurrent engineering team environment to account for changes such as cycle time increases in early product development phases.

Focusing on the process, not the product, is the key to implementing statistical process control in low-volume manufacturing environments. One approach is to initially assume that all products are being produced by a common process. Data can be used to verify or refute this assumption. If it is refuted, the appropriate subprocesses that must be monitored separately can be identified. A case study of a small batch machining process is used to describe this approach to implementing low-volume SPC.

The Aeronautical Systems Divisions's C-17 System Program Office has developed a quality management initiative called the R and M (Reliability and Maintainability) Quality Team Concept. Its purpose is to provide companies with better management of R and M during the full-scale engineering development acquisition phase. Douglas Aircraft Co. (DAC) agreed to implement the R and M Quality Team Concept during design of the C-17. This thesis examined the effect of the R and M Quality Team Concept as instituted by DAC on the quality management of the R and M process during C-17 design. Research assessed the concept's perceived impact on: (1) communication on R and M issues; (2) R and M problem solving; and (3) specific C-17 design changes. A survey was administered to DAC employees and interviews were conducted with management at DAC's Long Beach, CA, facility. Hypothesis testing using z and t-tests assisted in evaluating survey results. Study results revealed overall employee support for the R and M Quality Team Concept. The concept provided a method of R and M management and problem solving not available in a traditional program organization, and a number of C-17 design changes resulted from concept application.

The goal of the Unified Life Cycle Engineering (ULCE) program is to develop enhanced design environments that will allow supportability and producibility to be considered early in the product design cycle along with the usual factors of cost, performance, and schedule. An investigation into methods for the incorporation of producibility issues in early design is reported. Producibility is a product characteristic inherent in its design denoting ease and economy of manufacture. Many aspects of producibility are judgmental in character. However, to design products that are properly balanced with regard to all of the ULCE design factors, these qualitative aspects of a design must be handled and methods of trading off such factors against quantitative factors such as performance and cost measures must be developed. Methods of

measuring and evaluating factors related to producibility are discussed and a plan is presented for the development of a design environment of an aerospace design synthesis model with a producibility module. Included is a description of relevant design and manufacturing methodologies (e.g., Design for Manufacture and Assembly, Taguchi Methods, Quality Function Deployment, Statistical Process Control) and a discussion of the kinds of tools (hardware, software, and attitude) that can and have been established to ensure strong producibility characteristics in a product. In addition, an extensive bibliography is provided in an appendix. GRA

The issue of technology advancement and future space transportation vehicles is addressed. The challenge is to develop systems which can be evolved and improved in small incremental steps where each increment reduces present cost, improves, reliability, or does neither but sets the stage for a second incremental upgrade that does. Future requirements are interface standards for commercial off the shelf products to aid in the development of integrated facilities; enhanced automated code generation system slightly coupled to specification and design documentation; modeling tools that support data flow analysis; and shared project data bases consisting of technical characteristics cost information, measurement parameters, and reusable software programs. Topics addressed include: advanced avionics development strategy; risk analysis and management; tool quality management; low cost avionics; cost estimation and benefits; computer aided software engineering; computer systems and software safety; system testability; and advanced avionics laboratories - and rapid prototyping. The concept of total quality management (TQM) embodies a number of significant notions. Among these is the notion of statistical process control (SPC). The U.S. Army Depot System Command (DESCOM) has endorsed the concept of TQM and is actively pursuing the implementation of SPC throughout its organization. One of the difficulties inherent in the applications of SPC to the wide variety of DESCOM processes is the extensive amount of training required to collect process, and interpret the requisite statistical information. To reduce this training demand and to simplify the application of SPC over a broad range of processes, DESCOM is developing a generic automated SPC collection and interpretation system. This system interfaces with

individual stages from a large variety of industrial processes to provide automated data storage, presentation, and interpretation. The system is composed of the following six separate modules: process interface module; data storage and presentation module; pattern recognition module; pattern interpretation module; incremental learning module; and user interface module. The goal of the Advanced Launch System (ALS) is a more efficient launch capability that provides a highly reliable and operable system at substantially lower cost than current launch systems. Total Quality Management (TQM) principles are being emphasized throughout the ALS program. A continuous improvement philosophy is directed toward satisfying users' and customer's requirements in terms of quality, performance, schedule, and cost. Quality Function Deployment (QFD) is interpreted as the voice of the customer (or user), and it is an important planning tool in translating these requirements throughout the whole process of design, development, manufacture, and operations. This report explores the application of QFD methodology to launch operations, including the modification and addition of events (operations planning) in the engineering development cycle, and presents an informal status of study results to date. QFD is a technique for systematically analyzing the customer's (Space Command) perceptions of what constitutes a highly reliable and operable system and functionally breaking down those attributes to identify the critical characteristics that determine an efficient launch system capability. In applying the principle of QFD, a series of matrices or charts are developed with emphasis on the one commonly known as the House of Quality (because of its roof-like format), which identifies and translates the most critical information. The results are presented of internal Air Force Human Resources Laboratory (AFHRL) research investigating the potential applications of Quality Function Deployment (QFD) to Concurrent Engineering (CE). Influences from the Total Quality Management (TQM) initiative, as well as CE, have increased acquisition emphasis on customer satisfaction and proper definition of the Voice of the Customer. In weapon system acquisition the combat command's requirements are the voice of the customer and it is their needs and requirements that must be captured, defined, and satisfied. To help achieve this goal, as well as TQM and CE goals of improved acquisition efficiency and effectiveness, this research investigated the weapon system requirements process. A decision support environment accommodating the requirements process and incorporating the methods and tools will enhance CE through the earliest parts of design, the definition of the weapon system requirements, and the needs upon which those requirements are based. A finding of the research was QFD could be used as a paradigm for a Decision Support System (DSS) environment to incorporate the investigated methods, and thereby enhance the requirements definition, analysis, and management aspects of weapon system acquisition. Many engineering companies use a quality management system to ISO 9001 as a means of controlling quality and standards in their products and operations. The National Agency for Finite Element Methods and Standards has recently issued a quality systems supplement on the application of ISO 9001 to the use of finite element analysis in the design and validation of engineering products. A role model is presented for a quality system designed to fulfill the requirements of that document. Quality aspects of the following topics are covered: management of the analysis operation; acquisition; development and verification of software; qualification and documentation of analysis methods; project analysis; and education and training of personnel. Comments are included, based on experience of implementing finite element quality procedures. Author

The results of research conducted at Pacific Northwest Laboratory (PNL) for the DOE are regularly transferred from the laboratory to the private sector. The principal focus of PNL is on environmental research and waste management technology; other programs of emphasis include molecular science research. The technology transfer process is predicated on Quality to achieve its objectives effectively. Total quality management (TQM) concepts and principles readily apply to the development and translation of new scientific concepts into commercial products. The concept of technology transfer epitomizes the TQM tenet of continuous improvement: always striving for a better way to do things and always satisfying the customer. A successful technology transfer process adds value to society by providing new or enhanced processes, products, and services to government and commercial customers, with a guarantee of product pedigree and process validity. Total Quality Management (TQM) is a DoD initiative for continuously improving performance at every level, in every area of DoD responsibility. Implementing this philosophy will require a cultural change in the defense community. It will also require the intelligent use of appropriate analysis techniques. This report

describes the basic analytical tools used in TQM: Process flow charts, Ishikawa charts, Statistical process control, Histograms, Pareto diagrams, Scattergrams and the Shewhart cycle. For easier comprehension, a mythical scenario is used in which the tools are introduced to a willing, but untrained, manager (and to the reader) by a TQM specialist. GRA

Specific concurrent engineering practices vary among organizations. There are, however, various management practices that appear to work well for most organizations. This paper presents the reader with specific, useful examples from several defense contractors illustrating how multifunctional concurrent engineering teams are being organized and managed and how concurrent engineering team meetings are conducted and supported. The types of computer support that could be used to enhance the efficiency and effectiveness of concurrent engineering team meetings are identified. The general findings are that there exists a direct relationship between total quality management (TQM) and concurrent engineering, and that many applications of computer-aided group problem solving are possible and practical today for the concurrent engineering team meetings. Areas identified for additional research are the documentation of the decision process and rationale during the product and process definition, the capturing of lessons learned during the implementation of concurrent engineering, and the performance evaluation and training of team members. Viewgraphs are used to illustrate the reliability engineering and aerospace safety of the Space Transportation Main Engine (STME). A technology developed is called Total Quality Management (TQM). The goal is to develop a robust design. Reducing process variability produces a product with improved reliability and safety. Some engine system design characteristics are identified which improves reliability. E.R.

Total Quality Management (TQM) concepts adapted to the development of quality electronic components are discussed. TQM as applied in the U.S. is contrasted with possible TQM approaches in Europe. The need for the U.S. and Europe to rise to the challenge of Japan's lead in electronic component manufacturing is stressed. Ways in which TQM policies will affect cooperation between the U.S. and Europe are discussed. A TQM approach is predicted to be widespread in Europe four years after it is established in the U.S. ESA

The European qualification, approval or capability approval system is found to be poorly adapted to Very Large Scale Integration (VLSI) and Application Specific Integrated Circuits (ASICs). EQML, a European qualification system based on the QML system developed by the U.S. Department of Defense, is described. EQML content in terms of qualification and task definition in integrated circuit manufacturing is discussed. The procedure allows qualifications to be carried out by tradeoffs provided that the interfaces are controlled. ESA

Ways in which Statistical Process Control (SPC) can ensure continuous quality improvements, minimize the cost of ownership and generate a total quality environment for all manufacturing and quality control employees are outlined. Cpk and ppm defect rate dependency are discussed. A review of specific examples of SPC technique implementation in space semiconductors production shows how continuous quality improvements support specific space market needs. Two major applications are analyzed: (1) the enhancement of internal wire bonding process quality via SPC driven process improvement, and (2) how wafer manufacturing internal process control data can be used as a substitute for MIL STD 883 method 2010 internal visual inspections procedures. Use of the European Quality Management system EQML by part manufacturers, equipment manufacturers and system users is discussed. Evolution of normalized qualification standards enabling better confidence and cost efficiency in new product generation is discussed. Ways of improving development cycles, yields and product performances using the EQML system are outlined. The main phases involved in the qualification concept are identified. ESA

Technology approval is offered as an alternative to conventional component approval procedures. Statistical Process Control (SPC) and capability indices are used to demonstrate manufacturing capability. Applied to mandated systematic performance improvement, the procedure is intended to meet and exceed the requirements of current systems. Successful implementation of this standard should result in the products of a demonstrably higher quality and reduced cost in comparison to existing approval systems. Technology approval may be granted only to a manufacturer who has been granted manufacturers approval in accordance with the requirements of a recognized national system.

Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of document content, a title extension is added, separated from the title by three hyphens. The accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence.

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence.

February 1992

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

February 1992

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under the contract are shown. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

Typical Accession Number Index Listing

Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

Minimum air-mail postage to foreign countries is \$2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

STAR ENTRIES (N91-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, VA 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report number* shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: ESDU. Pricing information on specific data, computer programs, and details on Engineering Sciences Data Unit (ESDU) topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on the page titled ADDRESSES OF ORGANIZATIONS.
- Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, CA. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, DC 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of \$1.50 each, postage free.
- Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 52 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 52 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

PUBLIC COLLECTION OF NASA DOCUMENTS

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA – Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.
